

# How the pros do it

The image displays the GitHub Copilot interface within a code editor. On the left, a chat window titled "GITHUB COPILOT: CHAT" shows a conversation with a user named "monalisa" who asks to "Write unit tests for this function". GitHub Copilot responds with a Python script for unit testing the `parse_expenses` function. The script includes imports for `unittest` and `datetime`, a test class `TestParseExpenses` with two test methods, and a main block to run the tests. Below the code, a note states: "The code assumes that the datetime module is imported. The test cases cover different scenarios such as valid input, empty input, input with comments, invalid date format, and invalid value format." At the bottom of the chat is a prompt box: "Ask a question or type '/' for commands".

On the right, the code editor shows three files: `parse_expenses.py`, `addresses.rb`, and `sentiments.ts`. The `parse_expenses.py` file is open, displaying the following Python code:

```
1 import datetime
2
3 def parse_expenses (expenses_string):
4     """Parse the list of expenses and return the list of triples (date, amount, currency)
5     Ignore lines starting with #.
6     Parse the date using datetime.
7     Example expenses_string:
8         2023-01-02 -34.01 USD
9         2023-01-03 2.59 DKK
10        2023-01-03 -2.72 EUR
11
12    """
13    expenses = []
14
15    for line in expenses_string.splitlines():
16        if line.startswith("#"):
17            continue
18        date, value, currency = line.split(" ")
19        expenses.append((datetime.datetime.strptime (date, "%Y-%m-%d"),
20                        float (value),
21                        currency))
22
23    return expenses
24
25 expenses_data = '''2023-01-02 -34.01 USD
26                  2023-01-03 2.59 DKK
27                  2023-01-03 -2.72 EUR'''
28
29
